VIEWS OF A WEBSITE IN THREE DIFFERENT DEVICES

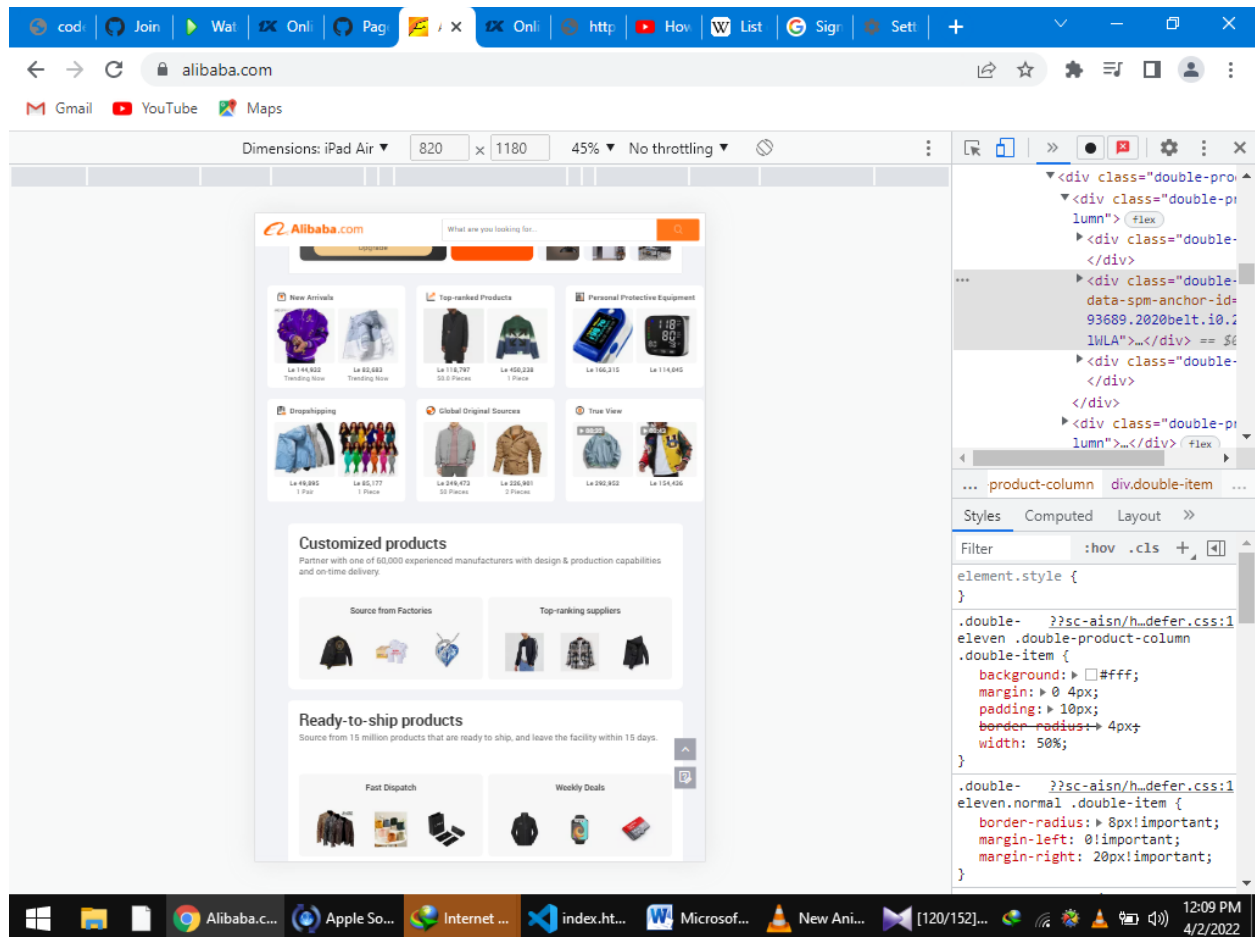

COMPUTER VIEW

OBSERVATIONS

The Website used is **Alibaba**, which is an online purchasing and selling of products websites. You go in search of an item of your desire, if available you make an order. In a computer view the website contents are displayed clearly and comprehensibly. Because it is made wide. The view is mostly in **A Horizontal View**.

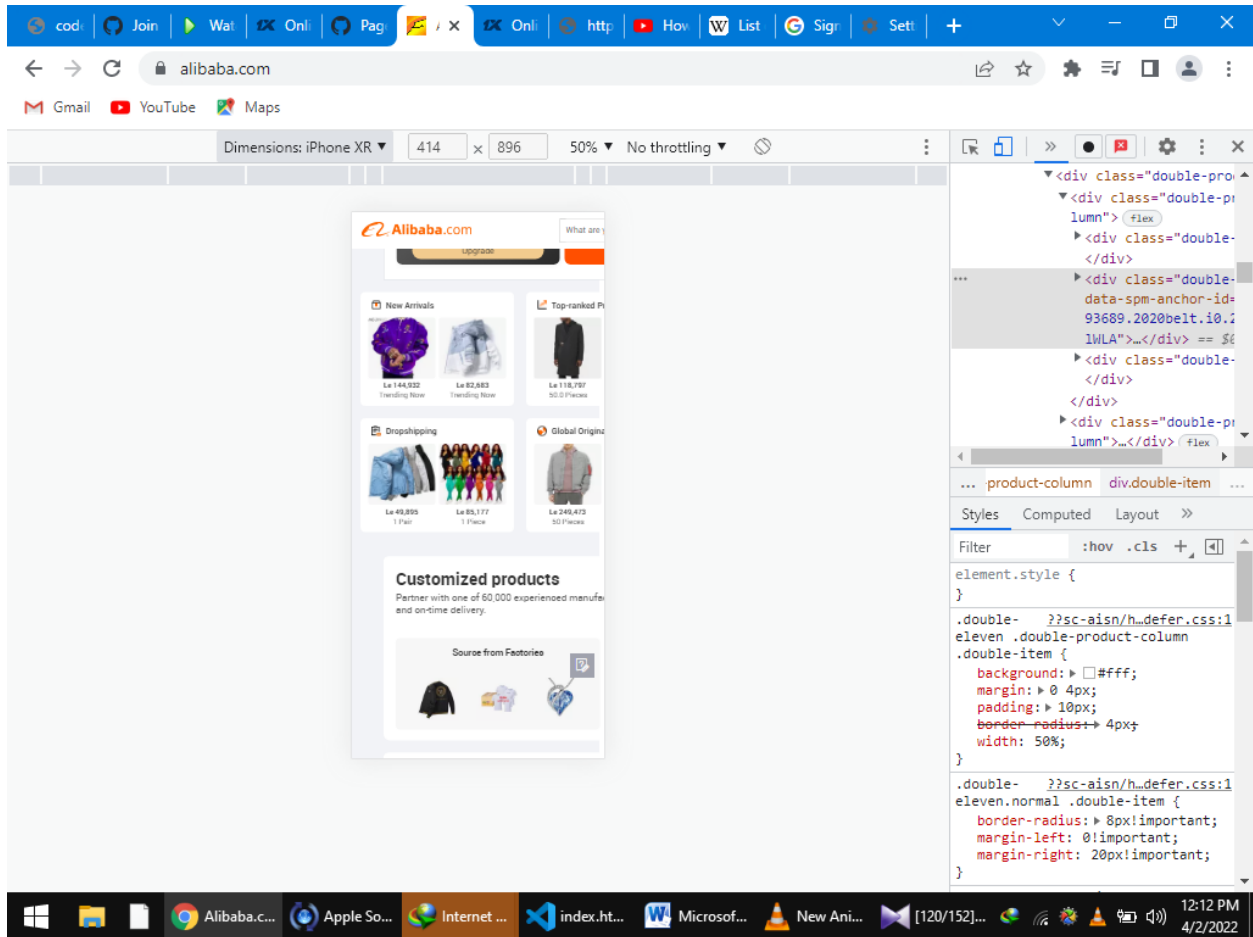

IPAD VIEW

OBSERVATIONS

The website is displayed a bit narrow compared to the Computer view. This is due to the device's size. The larger the device, the greater the possibility for every content of the website to be displayed clearly and broadly. So therefore, all about the view is the changing of the view size. The view is mostly in **A Vertical View**. In this view the search box is not shown. Has it been a navigation bar, it also would not have been shown.

PHONE VIEW

OBSERVATIONS

The phone's view is the narrow of it all. The border size of boxes is of little value. The float also is of narrow size. It is **Vertically Narrower**. Not every content is displayed at once. You will have to scroll in orders to see the other contents. In this view the search box is not shown. Has it been a navigation bar, it also would not had shown.
